Switchable Glass

Dimmable Glass

**Heated Glass** 

## Switchable Glass

Switchable glass can be switched electronically between transparent or discretion with the flip of a switch.

With this technology, individual areas can be used for a variety of purposes and highlights can be created on board.

## Dimmable Glass

Dimmable solar control glass provides excellent thermal insulation and a pleasant room climate.

In this way, the light transmission of the glass can be flexibly adapted to the users need depending on the weather.

This is ensured by the variable g-value of the glass. In this way, the room-heating solar energy can be "locked out" with maximum dimming, letting in solar energy with minimum dimming.

Sun protection and daylight are not mutually exclusive - daylight transmission varies between 56-10% depending on the colouring of the glass.

Heated glass is predominantly used in those places where a clear view is required despite frost and a tendency towards condensation resulting from different temperatures

on the inside and outside, alongside the normal performance for the glass.

This glass is chiefly used on command bridges. In order to make the transparent area as large as possible on the bridge, the use of structural sealant glazing suggests itself here.

This allows for the realization of extremely narrow window struts. Since a clear view from the bridge is required, the special glass used is rigorously kept free from distortions.

Furthermore, additional specifications,

shading systems or wiper systems can be considered.
